|---|---------------------------------------|
| <b>Name(s)</b><br><b>Dhiraj R. Holden</b>   | <b>Project Number</b><br><b>S1605</b> |
| <b>Project Title</b><br><b>An Analysis of the Primitive Cycles Existence Conjecture</b>   |                                       |
| <b>Abstract</b><br><b>Objectives/Goals</b><br>The objective of this project is to make progress toward the proof of the Primitive Cycles Existence Conjecture. Also, the project intends to present an analysis of total stopping time graphs for $3x+d$ and an application of the $3x+d$ function to cryptography.<br><b>Methods/Materials</b><br>The number of iterations $k$ takes before the $k$ th iteration is equal to the $k+n$ th iteration for any $n$ for any $k$ , i.e. total stopping times of the $3x+d$ function, were analyzed using a Java program to find stopping times for 1 to 9999 for $d = 1,5,7,11,13,17$ and plotted it.<br><b>Results</b><br>The first theorem details conditions for a number divisible by a number of a certain form that is necessary for it to be a primitive cycle, and the second theorem builds on the first theorem to determine under what conditions a possible cycle can exist. These cycles are a subset of all cycles for all $d$ .<br><b>Conclusions/Discussion</b><br>The resulting graph demonstrated a logarithmic relationship between the number and the stopping time. Also for further research, these theorems may be generalized to assist in proving the Primitive Cycles Existence Conjecture. |                                       |
| <b>Summary Statement</b><br>This project conducts an analysis of the Primitive Cycles Existence Conjecture concerning a generalization of the $3x+1$ problem to $3x+d$ .  |                                       |
| <b>Help Received</b><br>Mother looked over report and abstract; Father helped with poster formatting and also looked over report; Dr. Haxell critiqued theorems.  |                                       |
