| <b>Name(s)</b><br><b>Johan G. Thuen</b>  | <b>Project Number</b><br><b>J1521</b> |
| <b>Project Title</b><br><b>Lights from the Sea: How Do Light/Dark Cycles Affect Bioluminescence?</b>   |                                       |
| <b>Abstract</b><br><b>Objectives/Goals</b><br>The purpose of my project is to see how different light/dark cycles affect bioluminescence in dinoflagellates. I believe that as the light cycle nears zero hours per 24 hour cycle the glow will diminish and at zero hours per day of light I believe they will stop glowing. I also predict that if there is no dark time (24 hours of light) they will stop glowing.<br><b>Methods/Materials</b><br>Twenty-one test tube samples of the dinoflagellate, <i>Pyrocystis fusiformis</i> , a large unicellular bioluminescent algae, were observed under seven different light/dark cycles. These cycles ranged from zero hours of light during a 24 hour cycle to 24 hours of light during a 24 hour cycle. Observations were recorded four times a day for seven days. The seven day experiment was then repeated two more times.<br><b>Results</b><br>The data results showed that 12 to 20 hours of light produced the most consistent brightness during the dark cycle. Eight hours or less of light during a 24 hour cycle began to lose brightness during its dark cycle and zero hours of light could not maintain its brightness.<br><b>Conclusions/Discussion</b><br>My conclusion is that bioluminescent dinoflagellates need a minimum amount of light during a 24 hour cycle to maintain their glow and that too much light or dark will diminish their brightness. |                                       |
| <b>Summary Statement</b><br>My project demonstrates how different light/dark cycles affect the bioluminescence of dinoflagellates.   |                                       |
| <b>Help Received</b><br>My Mother helped type my report. She also did the 11 a.m. observations on school days.   |                                       |
