

**CALIFORNIA STATE SCIENCE FAIR  
2003 PROJECT SUMMARY**

<b>Name(s)</b> Maya J. Mileck	<b>Project Number</b> <b>J1616</b>
<b>Project Title</b> <b>Size vs. Depth: The Relationship Between the Size of a Seed and Its Ideal Planting Depth</b>	
<p style="text-align: center;"><b>Abstract</b></p> <p><b>Objectives/Goals</b> The Objective of my project was to find if the size of the seed determines the ideal planting depth.</p> <p><b>Methods/Materials</b> Six types of legume seeds were obtained and the weight and recommended planting depth recorded for each. Each type of seed was planted in a pot at five different depths, one seed at each depth. The shallowest being the surface, the deepest being twice the recommended planting depth, and the last three divided evenly between shallowest and deepest. This was repeated two times for a total of three pots for each type of seed. When the plants had grown for 17 days, their heights were measured and recorded. Finally, the entire experiment was repeated for verification.</p> <p><b>Results</b> In general, the smaller seeds preferred shallower planting depths and the larger seeds, deeper planting depths. The larger the seed, the deeper the preferred planting depth.</p> <p><b>Conclusions/Discussion</b> My conclusion is that, in most cases, there is a strong correlation between the size of a seed and its ideal planting depth.</p>	
<b>Summary Statement</b> Size vs. Depth explores the relationship between seed size and ideal planting depth.	
<b>Help Received</b> Friend helped with layout, neighbor helped with photos, teacher helped with grammar, mother helped with typing, father helped with growing.
