

**CALIFORNIA STATE SCIENCE FAIR  
2010 PROJECT SUMMARY**

<b>Name(s)</b> <b>Thomas V. Tuttle</b>	<b>Project Number</b> <b>J1526</b>
<b>Project Title</b> <b>Wave Blockers!</b>	
<p style="text-align: center;"><b>Abstract</b></p> <p><b>Objectives/Goals</b> My project was to find out what materials could block Wi-Fi waves the best.</p> <p><b>Methods/Materials</b> Using a transmitter (an Apple Time Capsule) and a receiver (an Apple MacBook Pro), I encased the transmitter in either aluminum foil, plastic wrap, wrapping paper, steel cake pans, a wooden box, a cardboard box or a lunchbox, and recorded the signal strength of the receiver (in bars, Max=4) at different distances up to 80 meters away. I also did a control test with no material surrounding the transmitter.</p> <p><b>Results</b> The steel cake pans brought the signal down to 0 in both tests, while the cardboard box, lunchbox and wrapping paper always stayed at 4 bars.</p> <p><b>Conclusions/Discussion</b> My conclusion is that steel is good for blocking Wi-Fi waves, and that a material's thickness may also be a factor when it's blocking Wi-Fi waves.</p>	
<b>Summary Statement</b> My project was to find out what materials could block Wi-Fi waves the best.	
<b>Help Received</b> Father helped set up the transmitter and took pictures; mother handled the receiver and reported readings.
