

# CALIFORNIA STATE SCIENCE FAIR 2015 PROJECT SUMMARY

<b>Name(s)</b> <p style="text-align: center;"><b>Timothy J. Varghese</b></p>	<b>Project Number</b>  <p style="text-align: right;">35255</p>
<b>Project Title</b> <p style="text-align: center;"><b>From Sums over Natural Numbers to Sums over Primes</b></p>	
<div style="display: flex; justify-content: space-between;"> <div style="width: 45%;"> <b>Objectives/Goals</b>  <p>Any sum over the naturals such as <math>1 + 2 + 3 \dots n = F(n)</math> can be converted to a sum over the primes such as <math>2 + 3 + 5 + \dots p_n = P(n)</math> where <math>p_n</math> is the <math>n</math>-th prime. I started by proposing an Expand-Sum-Prune (ESP) heuristic in which <math>P(n)</math> is approximated as <math>F(n \ln n) / \ln n</math>. ESP provides correct asymptotic results for sums of prime powers, duplicating a result of Salat-Znam. The goals of this project are:</p> <ol style="list-style-type: none"> <li>1. To examine the hypothesis that ESP fails when any one term is too large a fraction of the whole sum.</li> <li>2. To find new sums over primes never published earlier</li> <li>3. When ESP fails, to find better summation methods.</li> </ol> </div> <div style="width: 45%;"> <b>Abstract</b>  <p>Any sum over the naturals such as <math>1 + 2 + 3 \dots n = F(n)</math> can be converted to a sum over the primes such as <math>2 + 3 + 5 + \dots p_n = P(n)</math> where <math>p_n</math> is the <math>n</math>-th prime. I started by proposing an Expand-Sum-Prune (ESP) heuristic in which <math>P(n)</math> is approximated as <math>F(n \ln n) / \ln n</math>. ESP provides correct asymptotic results for sums of prime powers, duplicating a result of Salat-Znam. The goals of this project are:</p> <ol style="list-style-type: none"> <li>1. To examine the hypothesis that ESP fails when any one term is too large a fraction of the whole sum.</li> <li>2. To find new sums over primes never published earlier</li> <li>3. When ESP fails, to find better summation methods.</li> </ol> </div> </div>	
<b>Methods/Materials</b> <ol style="list-style-type: none"> <li>1. Series: I studied several sums over primes including the alternating series <math>(2 - 3 + 5 - 7 + \dots)</math>, reciprocal sums <math>(1/(2*3*5) + 1/(3*5*7) + \dots)</math>, and sums of prime powers <math>(2^2 + 3^2 + 5^2 + \dots)</math></li> <li>2. All estimates were checked for accuracy using a Visual C program that uses the sieve of Eratosthenes to produce (and sum) all primes up to 1000000.</li> </ol>	
<b>Results</b> <ol style="list-style-type: none"> <li>1. Alternating sum: Consider <math>A = 2 - 3 + 5 - 7 + \dots</math>. I provide a new estimate of <math> A  = 0.5 p_n</math> with errors less than 2% for <math>500 &lt; n &lt; 78,401</math> by summing half the prime gaps using a modified ESP method. When my estimate was posed on Math Overflow (viewed 386 times, 11 votes +1 badge for "good question"), mathematicians felt my new result was "almost certainly true". However, using current sieve techniques they can only prove unconditionally that <math> A  &lt; p_n / 64</math>. My method generalizes to alternating series of prime powers. I published a new series for alternating primes squared in the Online Encyclopedia on Integer Sequences (OEIS) as A240860.</li> <li>2. Reciprocal sums: I prove that <math>S = 1/(2*3*5) + 1/(3*5*7) + \dots</math> converges and <math>0.0474 &lt; S &lt; 0.0475</math>, published in the OEIS as A242187 using a Bound Reduce that applies to the infinite series for <math>e</math>.</li> <li>3. Better estimates for sums of prime powers: I found a better approximation than the Salat-Znam estimate using a balancing constant <math>c</math>. I found experimentally that the best values of <math>c</math> are roughly 0.6 for prime sums, 0.7 for squared sums, and 0.9 for cubed sums</li> <li>4. New estimates from old: I found a new asymptotic estimate for prime products two at a time with 2% error, added to the OEIS as A024447.</li> </ol>	
<b>Conclusions/Discussion</b> <p>The hypothesis that ESP method fails if any term dominates (limit of ratio of largest term to sum does not tend to zero) is supported by results</p>	
<b>Summary Statement</b> <p>As in Aladdin where the peddler promises new lamps for old, I seek new series over primes from old series over integers, and new formulas derived from formulas for integers</p>	
<b>Help Received</b> <p>Neil Sloane, head of OEIS helped refine hypothesis, Erich Bach (Wisconsin) helped make program efficient, Father helped with program. Robert Oliver (Stanford) gave valuable suggestions.</p>
