

CALIFORNIA STATE SCIENCE FAIR 2016 PROJECT SUMMARY

Name(s)	Project Number
Alexandria Cordero; Genessis Garcia; Melanie Le	
	36398
Project Title	
The Effect of Different Environmental Conditions on Witchife Activity	
Abstract	
Objectives/Goals	$\ \setminus \mathcal{I} \rangle$
Our objective for this study was investigating any possible correlations between	physiological differences,
biological differences, and various environmental conditions from a large group	of an mals and possible
increased activity from wildlife.	\smile
Methods/Materials	
Data from camera traps from Tejon Ranch Conservancy Google Spradsheets Results	plicrosoft Excel.
Animal activity increased during a variety of environmental Anditions no variety	tested the most active
Animal activity increased during a variety of environmental conditions and we periods with their corresponding variables. A chi-square test showed that there	was a strong correlation
between certain conditions and different animals.	was a strong correlation
Conclusions/Discussion	
Statistical analysis of data showed that there is a significant correlation between	n certain conditions and
different wildlife species. The strongest correlations were present within specie	s within predator and prey
Statistical analysis of data showed that there is a significant correlation between different wildlife species. The strongest correlations were present within specie groupings, showing that certain environmental conditions do have an effect on	the activity of animals to
an extent.	-

Summary Statement	
We found a strong correlation between a variety of environmental conditions and	nd increased activity from
different species.	
Haln Dessived	
Help Received	
We obtained the camera trap data from Tejon Ranch Conservancy and member	s of the California State
University of Bakersfield (CSUB) Geology department assisted in our understa	nding of the statistical
analysis.
